

MOBILE UI

MOBILE ECOSYSTEM

- This chapter looks at some of the clouds in the sky and how each part plays into the ecosystem as a whole.
- It also looks at how you can get started with mobile.
- Think of the mobile ecosystem instead as a system of layers.
- Each layer is reliant on the others to create a seamless, end-to-end experience.

The layers of the mobile ecosystem

Operators

- The base layer in the mobile ecosystem is the operator.
- Operators can be referred to as **Mobile Network Operators (MNOs)**.
- Operators are what essentially make the entire mobile ecosystem **work**.
- The operator's role in the ecosystem is to **create and maintain a specific set of wireless services over a reliable cellular network**

Networks

- Operators operate wireless networks. Remember that cellular technology is just a radio that receives a signal from an antenna. The type of radio and antenna determines the capability of the network and the services you can enable on it.

GSM mobile network evolutions

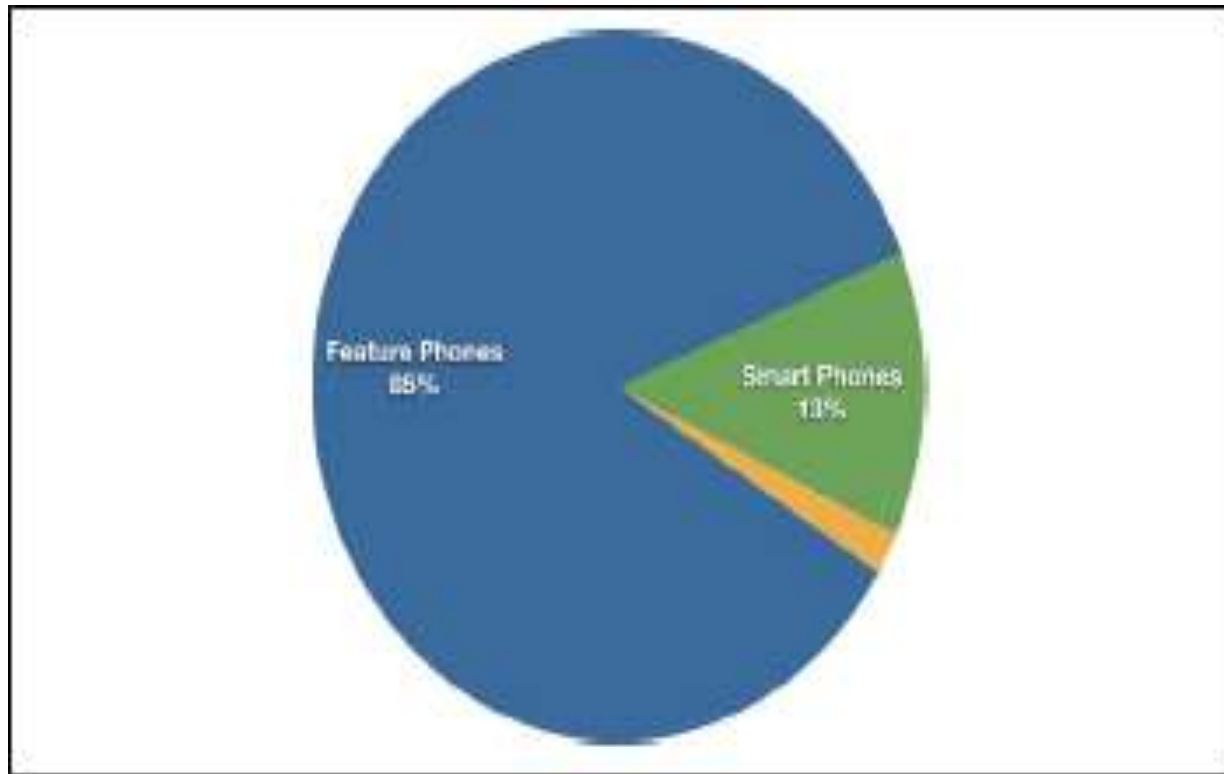

2G	Second generation of mobile phone standards and technology	Theoretical max data speed
GSM	Global System for Mobile communications	12.2 KB/sec
GPRS	General Packet Radio Service	Max 60 KB/sec
EDGE	Enhanced Data rates for GSM Evolution	59.2 KB/sec
HSCSD	High-Speed Circuit-Switched Data	57.6 KB/sec

3G	Third generation of mobile phone standards and technology	Theoretical max data speed
W-CDMA	Wideband Code Division Multiple Access	14.4 MB/sec
UMTS	Universal Mobile Telecommunications System	3.6 MB/sec
UMTS-TDD	UMTS + Time Division Duplexing	16 MB/sec
TD-CDMA	Time Divided Code Division Multiple Access	16 MB/sec
HSPA	High-Speed Packet Access	14.4 MB/sec
HSOPA	High-Speed Downlink Packet Access	14.4 MB/sec
HSUPA	High-Speed Uplink Packet Access	5.76 MB/sec

Devices

- **Smartphones** make up a small sliver of worldwide market share and maintain a healthy percentage in the United States and the European Union;
- smartphone market share is growing with the introduction of the **iPhone** and devices based on the **Android platform**. As next-generation devices become a reality, the distinction between feature phones and smartphones will go away.
- In the next few years, **feature phones** will largely be located in emerging and developing markets.

Breakdown of devices

Platforms

- A mobile platform's **primary duty is to provide access to the devices.** To run software and services on each of these devices, you need a platform, or a core programming language in which all of your software is written. Like all software platforms, these are split into three categories: **licensed, proprietary, and open source.**

Licensed

- Licensed platforms are sold to device makers for nonexclusive distribution on devices. The goal is to create a common platform of development Application Programming Interfaces (APIs) that work similarly across multiple devices with the least possible effort required to adapt for device differences, although this is hardly reality
- Java Micro Edition (Java ME)
- Binary Runtime Environment for Wireless (BREW)
- Windows Mobile
- LiMo

Proprietary

- Proprietary platforms are designed and developed by device makers for use on their devices.
- Palm
- BlackBerry
- iPhone

Open Source

- Open source platforms are mobile platforms that are **freely available for users to download, alter, and edit.**
- **Android** is one of these platforms.

Operating Systems

- It used to be that if a mobile device ran an operating system, it was most likely considered a **smartphone**.
- Although not all phones have operating systems, the following are some of the most common:
- **Symbian , Windows Mobile, Palm OS, Linux , Mac OS X, Android**

Application Frameworks

- Application frameworks often run on top of operating systems, **sharing core services such as communications, messaging, graphics, location, security, authentication, and many others.**
- Java
- S60
- BREW
- Flash Lite
- Web Runtimes (WRTs)

Applications

- Application frameworks are **used to create applications, such as a game, a web browser, a camera, or media player.** Although the frameworks are well standardized, the devices are not. The largest challenge of deploying applications is **knowing the specific device attributes and capabilities.**

Services

- Services include tasks such as accessing the Internet, sending a text message, or being able to get a location—basically, anything the user is trying to do.

Types of Mobile Applications

- SMS

Pros

- They work on **any mobile device** nearly instantaneously.
- They're useful for **sending timely alerts** to the user.
- They can be incorporated into any web or mobile application.
- They can be **simple to set up** and manage.

- Cons

- They're **limited to 160 characters**.
- They provide a **limited text-based experience**.
- They can be **very expensive**.

Mobile Websites

Pros

- They are easy to create, maintain, and publish.
- They can use all the same tools and techniques you might already use for desktop sites.
- Nearly all mobile devices can view mobile websites.

Cons:

- They can be difficult to support across multiple devices.
- They offer users a limited experience.
- Most mobile websites are simply desktop content reformatted for mobile devices.
- They can load pages slowly, due to network latency.

Mobile Web Widgets

Pros

- They are **easy to create**, using basic HTML, CSS, and JavaScript knowledge.
- They can be **simple to deploy** across multiple handsets.
- They offer **an improved user experience** and a richer design, tapping into device features and offline use.

Cons

- They **typically require a compatible widget** platform to be installed on the device.
- **They cannot run in any mobile web browser.**
- They **require learning additional proprietary**, non-web-standard techniques.

Mobile Web Applications

Pros

- They are **easy to create**, using basic HTML, CSS, and JavaScript knowledge.
- They are **simple to deploy** across multiple handsets.
- They **offer a better user experience** and a rich design, tapping into device features and offline use.
- **Content is accessible on any mobile** web browser.

Cons

- The **optimal experience might not be available** on all handsets.
- They **can be challenging** (but not impossible) to support across multiple devices.
- They **don't always support native application features**, like offline mode, location lookup, filesystem access, camera, and so on.

Native Applications

Pros

- They offer a **best-in-class user experience**, offering a rich design and tapping into device features and offline use.
- They **are relatively simple to develop** for a single platform.
- You **can charge for applications**.

Cons

- They **cannot be easily ported** to other mobile platforms.
- Developing, testing, and supporting multiple device platforms is incredibly **costly**.
- They **require certification and distribution** from a third party that you have no control over.
- They **require you to share revenue** with the one or more third parties.

Games

Pros

- They provide a simple and easy way to create an immersive experience.
- They can be ported to multiple devices relatively easily.

Cons

- They can be costly to develop as an original game title.
- They cannot easily be ported to the mobile web.

Mobile Information Architecture

- The structural design of shared information environments .
- The combination of organizations, labeling, search, and navigation systems within websites and intranets.
- The art and science of shaping information products and experiences to support usability and findability .
- An emerging discipline and community of practice focused on bringing principles of design and architecture to the digital landscape.

Information architecture

The organization of data within an informational space. In other words, how the user will get to information or perform tasks within a website or application.

Interaction design

The design of how the user can participate with the information present, either in a direct or indirect way, meaning how the user will interact with the website or application to create a more meaningful experience and accomplish her goals.

Information design The visual layout of information or how the user will assess meaning and direction given the information presented to him.

Navigation design The words used to describe information spaces; the labels or triggers used to tell the users what something is and to establish the expectation of what they will find.

Interface design The design of the visual paradigms used to create action or understanding.

The Elements of User Experience

Jesse James Garrett

jjg@jjg.net

22 March 2000

A basic reality: The Web was originally conceived as a hypertextual information space, but the development of increasingly sophisticated front- and back-end technologies has fostered its use as a simple software interface. This dual nature has led to much confusion, as user experience practitioners have attempted to adapt their knowledge to cases beyond the scope of its original applications. The goal of this document is to define some of these terms within their appropriate contexts, and to clarify the underlying relationships among these various elements.

Web as software interface

Visual Design: graphic treatment of interface elements that "look" or "look-and-feel"

Interface Design: as in traditional HCI (design of interface elements to facilitate user interaction with functionality)

Information Design: in the Tuftean sense, designing the presentation of information to facilitate understanding

Interaction Design: development of application flows to facilitate user tasks, defining how the user interacts with site functionality

Functional Specifications: "feature set", detailed descriptions of functionality the site must include in order to meet user needs

User Needs: externally derived goals for the site, identified through user research, ethnography/psychographics, etc.

Site Objectives: business, creative, or other internally derived goals for the site

Task-oriented

Concrete

Complexity

Web as hypertext system

Visual Design: visual treatment of text, graphic, page elements and navigational components

Navigation Design: design of interface elements to facilitate the user's movement through the information architecture

Information Design: in the Tuftean sense, designing the presentation of information to facilitate understanding

Information Architecture: structural design of the information space to facilitate efficient access to content

Content Requirements: definition of content elements required in the site in order to meet user needs

User Needs: externally derived goals for the site, identified through user research, ethnography/psychographics, etc.

Site Objectives: business, creative, or other internally derived goals for the site

Information-oriented

This picture is incomplete. The model outlined here does not account for secondary considerations (such as those arising during technical or content development) that may influence decisions during user experience development. Also, this model does not describe a development process, nor does it define how within a user experience development team. Rather, it seeks to define the key considerations that go into the development of user experience on the Web today.

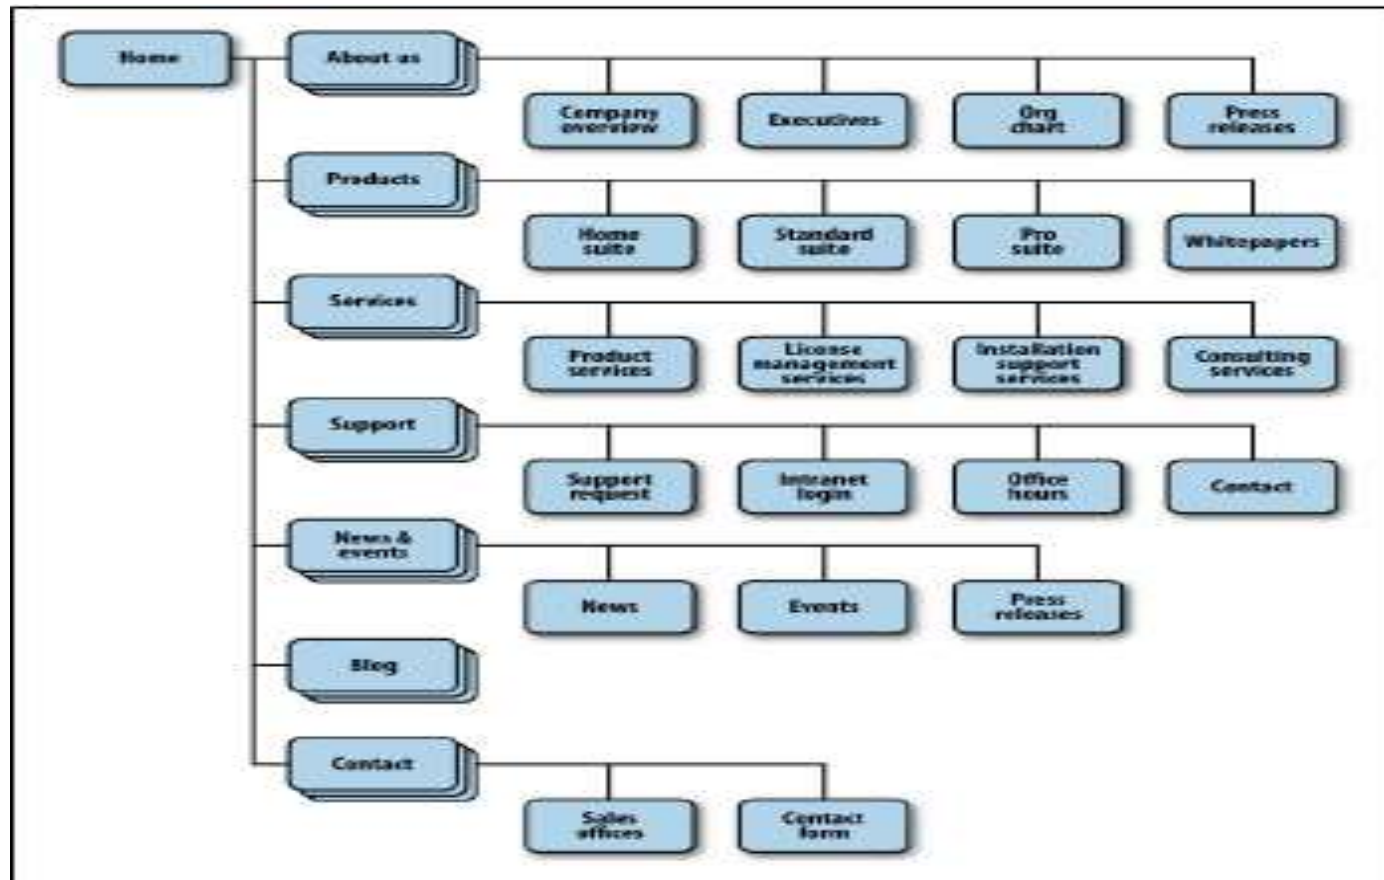

Mobile Information Architecture

- Keeping It Simple
- Site Maps

The first deliverable we use to define mobile information architecture is the site map. Site maps are a classic information architecture deliverable. They visually **represent the relationship of content to other content** and provide a map for how the user will travel through the informational space

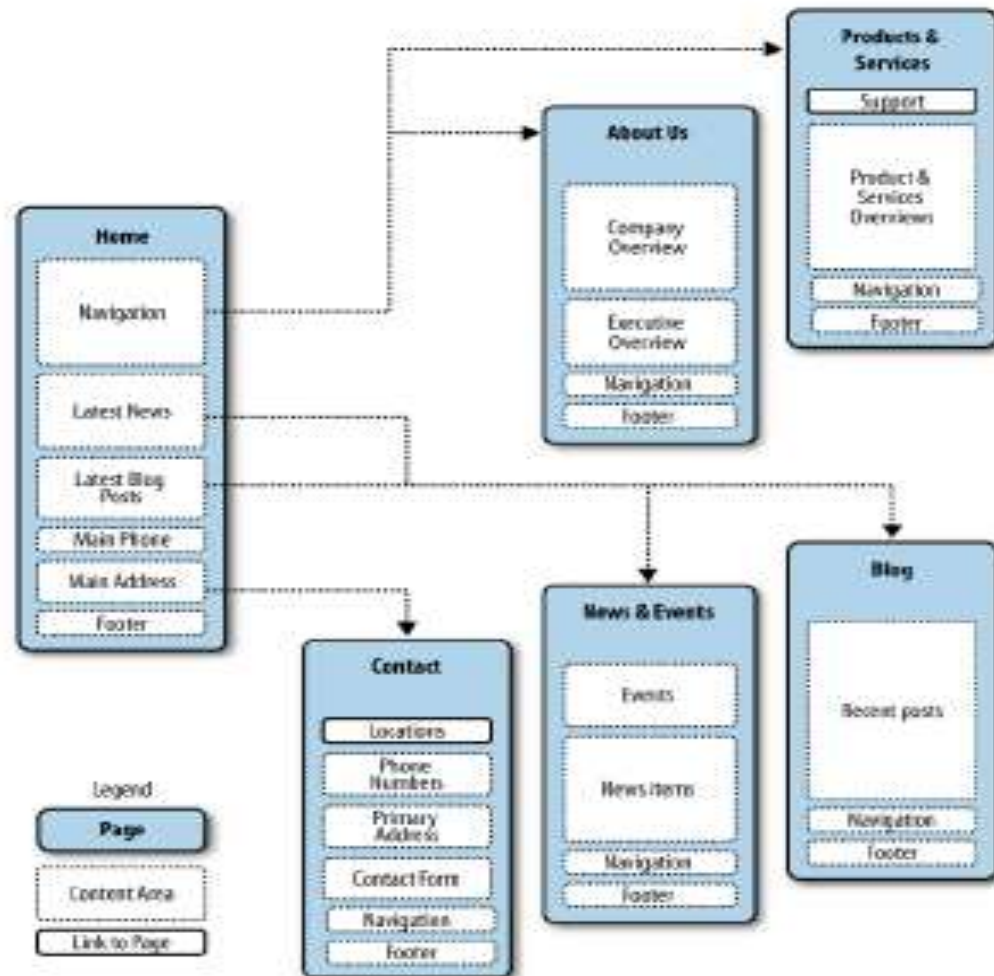

Limit opportunities for mistakes

An example of a bad mobile information architecture that was designed with desktop users in mind rather than mobile users

Confirm the path by teasing content

Clickstreams

Prototyping

Paper prototypes taking our printed-out wireframes or even drawings of our interface

Context prototype

Take a higher-end device that enables you to load full-screen images on it.

HTML prototypes

- The third step is creating a lightweight, semi-functional static prototype using XHTML, CSS, and JavaScript, if available.
- This is a prototype that you can actually load onto a device and produce the nearest experience to the final product, but with static dummy content and data.
- It takes a little extra time, but it is worth the effort.

Mobile Design

The Elements of Mobile Design

Context

- Who are the users? What do you know about them? What type of behavior can you assume or predict about the users?
- What is happening? What are the circumstances in which the users will best absorb the content you intend to present?

- When will they interact? Are they at home and have large amounts of time? Are they at work where they have short periods of time? Will they have idle periods of time while waiting for a train, for example?
- Where are the users? Are they in a public space or a private space? Are they inside or outside? Is it day or is it night?
- Why will they use your app? What value will they gain from your content or services in their present situation? • How are they using their mobile device? Is it held in their hand or in their pocket? How are they holding it? Open or closed? Portrait or landscape?

Message

- what you are trying to say about your site or application visually.

Look and Feel

- Look and feel is used to evoke action—how the user will use an interface.

Layout

- Layout is an important design element, because it is how the user will visually process the page, but the structural and visual components of layout often get merged together, creating confusion and making your design more difficult to produce

Color

The fifth design element, color, is hard to talk about in a black-and-white book.

These days, we have nearly the entire spectrum of colors to choose from for mobile designs.

Typography

Traditionally in mobile design, you had only one typeface that you could use and that was the device **font**. The only control over the presentation was the size.

Graphics

- The final design element is graphics, or the images that are used to establish or aid a **visual experience**. Graphics can be used to supplement the **look and feel**, or as content displayed inline with the text.

Mobile 2.0

- Mobile is already a medium, but the consensus is that by leveraging the power of the Web, **integrating web services into the mobile medium is the future of mobile development.**
- When the **iPhone exploded onto the scene, it increased the usage of the mobile web by its users** to levels never seen before.
- The spur of new mobile web apps created just for the iPhone doubled the number of mobile websites available in under a year.
- If **Web 2.0 taught us that the Web is the platform**, then **Mobile 2.0 tells us that mobile will be the primary context** in which we leverage the Web in the future.
